}

```

- Breakpoint at 0xf0100040
- Each time the function is called a new stack frame is initialized and the first two values of the initialised stack frame are the ebp and eip of the calling function.
- Size of each stack is 32 bytes.
- 32 bits is 4 bytes-since each stack is 32 bytes therefore 32/4 is 8 words.
- ebp, eip, ebx of the current iteration,ebx of the previous iteration,ebp of the stack called before this.

```

sai@sai: ~/6.828/lab1
sai@sai:~/6.828/lab1$ add-auto-load-safe-path /home/sai/6.828/lab1/.gdbinit
line to your configuration file "/home/sai/.gdbinit".
To completely disable this security protection add
set auto-load safe-path /
line to your configuration file "/home/sai/.gdbinit".
For more information about this security protection see the
"Auto-loading safe path" section in the GDB manual.  E.g., run from the shell:
info "(gdb)Auto-loading safe path"
+ target remote localhost:26000
warning: A handler for the OS ABI "GNU/Linux" is not built into this configuration
of GDB.  Attempting to continue with the default i386 settings.

The target architecture is assumed to be i386
[f000:ffff] 0xffff0: jmp $0xf000,$0xe05b
0x0000ffff in ?? ()
